WeddingOS

Product Requirements Document

Version 1.0 | Approved MVP Scope | India | English

One wedding. Two families. One shared workspace.

1. Product Overview

1.1 Product Vision

WeddingOS is a collaborative wedding management platform designed to simplify the entire Indian wedding planning journey. It provides one shared workspace where the bride, groom and their families can coordinate wedding events, guests, invitations, expenses, vendors, tasks and memories.

1.2 Problem Statement

Indian weddings involve multiple events, large guest lists, several vendors, shared financial responsibilities and coordination between two families. Common problems include wedding information scattered across platforms; difficulty coordinating responsibilities; guest invitation and RSVP management; tracking vendor quotations, expenses and outstanding payments; missed deadlines; and collecting and organising photographs and videos.

WeddingOS aims to solve these problems through a simple, unified wedding management workspace.

1.3 Product Goals

- Centralise wedding planning activities.
- Enable collaboration between both families.
- Simplify guest invitations and RSVP collection.
- Maintain transparent expense records.
- Organise vendor information and payments.
- Track event-related tasks.
- Provide event-wise photo and video galleries.
- Keep wedding information accessible after completion.

1.4 Product Principles

- Simplicity first.
- No unnecessary features.
- No AI functionality.
- No payment processing.
- No complicated permission systems.
- Responsive desktop and mobile experience.
- Suitable for different Indian families and wedding styles.

2. User Roles and Permissions

2.1 Admin

The bride and groom are the two administrators. Both administrators have equal authority.

Responsibilities: manage wedding details; create and manage events; manage guests and invitations; manage vendors; manage expenses; create and assign tasks; invite and remove managers; delete and restore expenses; delete gallery content; and control wedding completion, reopening, archiving and restoration. Certain lifecycle actions require approval from both administrators.

2.2 Manager

Managers are family members who help coordinate wedding preparations.

Permissions: full operational access to wedding modules; create and manage events; add, edit and manage guests; manage vendor records; add, view and edit expenses; create, assign and delete tasks; upload gallery photographs and videos; view everyone else's tasks and progress; and invite additional managers.

Restrictions: managers cannot delete or restore expenses, delete gallery content, change administrator membership or control the wedding lifecycle. All managers have equal operational permissions.

2.3 Guest

Guests do not need to register or log in. They access specific wedding information through unique invitation and gallery links.

Guest capabilities: view their family invitation; view invited events; submit and update RSVPs; view event galleries; upload photographs and videos using gallery upload links; and download individual gallery files. Guests cannot access the private wedding workspace.

3. Account Management and Authentication

3.1 Registration and Login

- Email and password registration.
- Google authentication.
- Mandatory email verification for email/password registration.
- Forgot Password functionality.

Google authentication will use Google's account verification.

3.2 Account Ownership Rules

- One account can own only one wedding.
- One account can participate as a manager in multiple weddings.
- Removing a manager from one wedding does not affect their membership in other weddings.

3.3 Wedding Workspace Access

Admins and managers access their weddings through their account dashboard after login. There is no public access to private workspaces.

4. Wedding Workspace Management

4.1 Wedding Creation

Initial required information: bride's name and groom's name.

Optional information: wedding date, wedding venue and location. The wedding date and venue can be added or modified later.

4.2 Wedding Workspace

Each wedding has one shared workspace for both families, including a dashboard, event management, guest management, expense management, vendor management, task management, and photo and video galleries.

4.3 Wedding Landing Page

Each wedding receives a shareable landing page displaying the bride's name, groom's name, basic wedding information, list of wedding events and a fixed default welcome message. The landing page is accessible through its shared link and is not publicly listed. There is no custom welcome-message editor.

5. Wedding Lifecycle Management

5.1 Active

The workspace is fully operational. All normal wedding management features are available.

5.2 Completed

Completion requires independent confirmation from both administrators. After completion, the workspace becomes read-only; existing records remain accessible; pending tasks are automatically marked completed by the system; invitations, event information and galleries remain accessible; and gallery uploads continue to be permitted for admins, managers and guests.

5.3 Reopening a Completed Wedding

Either administrator can initiate reopening. Both administrators must approve. After approval, editing access is restored.

5.4 Archived

Archiving requires approval from both administrators. After archiving, the workspace becomes read-only; admins and managers can view all records; guest invitation pages and existing galleries remain accessible; new gallery uploads are disabled; and permanent deletion is not supported.

5.5 Restoring an Archived Wedding

Either administrator can initiate restoration. Both administrators must approve. The workspace becomes active again after approval.

6. Event Management

6.1 Event Creation

Admins and managers can create events using predefined event templates or custom event creation. Example predefined events include Engagement, Haldi, Mehendi, Sangeet, Wedding and Reception.

6.2 Event Details

- Event name.
- Description.
- Date and time.
- Venue.
- Address.
- Google Maps location.
- Dress code.

Events can span multiple days. No separate multi-activity agenda is included in the MVP.

6.3 Event Visibility

Guest-facing information includes event name, description, date and time, venue and address, map location, and dress code. Private workspace information includes assigned managers, guest list, internal financial records and vendor information. Guests only see events for which their family has been invited.

6.4 Event Cancellation

Cancelled events remain visible with a clear cancellation status. When an event is cancelled, invitation pages update, invited families receive email notifications, and administrators and managers can share the cancellation through WhatsApp.

6.5 Event Updates

When event details change, invitation pages update automatically, families receive email notifications, and WhatsApp sharing is available through a prefilled message. WhatsApp messages are sent manually by users.

7. Guest Management

7.1 Adding Guests

Supported methods: manual entry, Excel import and CSV import. One guest record represents one invited family. Only the family head is invited as the primary contact. Individual family-member invitations are not supported.

7.2 Guest Information

Mandatory: family head's name and email address. Optional: phone number and guest category.

7.3 Guest Categories

Provide predefined categories and support custom categories. Examples include Bride's Family, Groom's Family, Relatives, Friends, Colleagues and Neighbours. Admins and managers can create, rename, delete and assign categories.

7.4 Excel and CSV Import

Import workflow: upload file; preview records; identify missing or invalid information; identify possible duplicate families; review records; and confirm import. Duplicate records must never be merged automatically. Users decide whether to keep both records or merge them.

7.5 Guest Invitations

Each invited family receives one unique invitation URL and one personalised invitation page. Requirements: unique and unpredictable link; no guest registration, login or OTP; permanent validity unless the guest record is deleted; and access based on possession of the unique URL. Deleting a guest family immediately deactivates its invitation link.

7.6 RSVP

Supported responses are Yes, No and Maybe. There is one RSVP per family per invited event. Guests can update their RSVP anytime. Admins and managers can view all RSVP responses. Guests cannot see other families' responses.

7.7 Attendance Estimation

Potential attendance = total invited families × 3. RSVP-based estimated attendance = families responding Yes × 3. These figures are estimates, not confirmed individual headcounts.

8. Expense Management

8.1 Purpose

WeddingOS is a financial record-keeping platform. It does not transfer money, process UPI or card payments, connect to bank accounts, or make payments to vendors. All payments happen outside the application. Users manually record payment information.

8.2 Expense Permissions

Admins and managers can add expenses, view expenses, edit descriptive expense details, record additional expenses, add payment instalments, and upload receipts and invoices. Only administrators can delete expenses, view the recycle bin and restore deleted expenses.

8.3 Expense Information

- Expense title.
- Original agreed amount.
- Category.
- Optional event.
- Optional vendor.
- Payment status.
- Payment date.
- Receipts and invoices.
- Created-by information.

8.4 Expense Categories

Predefined categories include Venue; Catering; Photography and Videography; Decoration; Makeup and Beauty; Clothing and Jewellery; Transportation; Accommodation; Entertainment; Invitations and Printing; and Miscellaneous. Admins and managers can create custom categories.

8.5 Additional Expenses

Existing recorded amounts cannot be overwritten or reduced. Additional expenditure must be recorded separately, with an additional amount and optional explanation. Example: original agreed amount ■80,000 plus additional decoration work ■10,000 results in a total expense of ■90,000. Descriptive information such as title, category and vendor can be edited without changing recorded amounts.

8.6 Payment Instalments

Payments are recorded separately from expense amounts. Each payment record includes amount paid, payment date, payment method and optional receipt or invoice. Example: agreed expense ■80,000; advance ■20,000; second payment ■30,000; remaining ■30,000. WeddingOS calculates paid and outstanding amounts.

8.7 Expense Recycle Bin

Deleted expenses move to a recycle bin. Administrators can view deleted expenses and restore them. Deletion information records the expense deleted, person who deleted it, date and time of deletion, and whether it was restored. No general activity-history module is included.

8.8 Expense Dashboard

Show total wedding expenditure, total amount paid, total outstanding amount, category-wise breakdown and event-wise breakdown. No budgeting, forecasts or advanced financial analytics.

9. Vendor Management

9.1 Vendor Discovery

Users can discover publicly available business listings. Search criteria are vendor category and city or location. Users enter the city manually. No curated verified vendor marketplace is included.

9.2 Vendor Categories

Examples include Venues and Banquet Halls; Catering; Photography and Videography; Decoration and Flowers; Makeup and Beauty; DJs and Entertainment; Transportation; Accommodation; Invitations and Printing; and Other.

9.3 Vendor Contact

Users can contact vendors through available phone numbers, email addresses and websites.

9.4 Manual Vendor Entry

Support business name, contact person, phone number, address, category, quoted price and notes. Admins and managers can edit saved vendor details.

9.5 Vendor Status

Supported stages: Shortlisted, Contacted, Finalised and Completed.

9.6 Vendor Financial Records

For finalised vendors, record quotation, agreed amount, advance paid and remaining payment. Vendor financial records connect to the expense module to avoid duplicate counting. Vendors can be removed from the active list while preserving historical financial records. No vendor accounts, booking portals or side-by-side comparison feature.

10. Task Management

10.1 Task Creation

Admins and managers can create tasks. Every task must belong to an event.

10.2 Task Information

Tasks support title, simple description, optional due date, one or multiple assignees, and status.

10.3 Task Statuses

Only three statuses: Pending, In Progress and Completed.

10.4 Task Permissions

Admins and managers can create tasks. Tasks can have multiple assignees. Assigned users can update status. Any one assignee can mark a shared task Completed. Admins and managers can delete tasks. Managers can view everyone else's tasks and progress.

10.5 Task Restrictions

Not included: priority system, comments, attachments, additional status categories or a separate reassignment dashboard. When a manager leaves or is removed, their pending tasks must be reassigned by an administrator. When the wedding is completed, pending tasks are automatically marked system-completed.

11. Photo and Video Galleries

11.1 Gallery Structure

Each event has its own gallery containing a Photos tab and a Videos tab. No guest-created albums or folders.

11.2 Gallery Access Links

Each event has two separate links. Viewing link: anyone with the viewing link can view and download individual files. Uploading link: anyone with the uploading link can upload photographs and videos. The event QR code opens the uploading link.

11.3 Gallery Permissions

Admins can view, upload, delete individual files and bulk-delete files. Managers can view and upload but cannot delete. Guests can view through the viewing link, upload through the uploading link and download individual files, but cannot delete. Guests can upload to any event gallery through its upload link or QR code.

11.4 Gallery Upload Behaviour

- No guest login.
- No guest registration.
- No uploader name required.
- Immediate upload visibility.
- No admin approval.
- Photos and videos supported.
- Automatic compression before upload where supported.
- No visible file-size limit.
- No fixed per-wedding storage allowance in the interface.
- Reasonable technical safeguards apply behind the scenes.

11.5 Gallery Downloads

Guests can download individual photographs and videos. No ZIP or bulk download feature.

11.6 Gallery Lifecycle

Active wedding: admins, managers and guests can upload. Completed wedding: admins, managers and guests can continue uploading. Archived wedding: all new uploads are disabled. Existing galleries remain accessible permanently after completion and archiving.

12. Dashboard

Admins and managers share the same dashboard.

12.1 Upcoming Events

Displays upcoming wedding functions and their important details.

12.2 Tasks

Displays pending and in-progress tasks.

12.3 Expense Summary

Displays total expenditure, paid amount, outstanding amount and expense breakdown.

12.4 RSVP Summary

Displays total families invited, Yes responses, No responses, Maybe responses and families with no response. No in-app notification centre is included.

13. Notifications and Communication

13.1 Guest Email Notifications

Guest email addresses are mandatory. Send email notifications for event date changes, venue changes, important event information changes and event cancellation.

13.2 WhatsApp Sharing

Provide prefilled WhatsApp messages for guest invitations, updated invitations and event cancellation announcements. Messages are shared manually. No automatic WhatsApp messaging.

13.3 Internal Notifications

No notification centre or routine task/RSVP email alerts for admins and managers in the MVP. Guest email notifications for event changes and cancellations remain supported.

14. Non-Functional Requirements

14.1 Responsiveness

The application must work across desktop, tablet and mobile browsers. All core functionality should be usable on mobile.

14.2 Security

- Private workspace access requires authentication.
- Guests access only through their specific invitation or gallery links.
- Invitation links must be unique and unpredictable.
- Manager invitation links must be single-use and expire after seven days.
- Removing a manager immediately revokes workspace access, including active sessions.
- Guest invitation deletion immediately invalidates the corresponding link.
- Only administrators can delete expenses and gallery content.

14.3 Data Preservation

- Historical expense records must be preserved when a vendor or manager is removed.
- Completed tasks remain in the records.
- Archived wedding records remain accessible.
- Galleries remain accessible after completion and archiving.

14.4 Performance and Storage

Provide a responsive user experience, image and video compression where supported, and multiple-file uploads. Apply reasonable technical storage safeguards. No visible per-wedding storage allowance in the MVP interface.

14.5 Accessibility and Usability

- Clear navigation.
- Consistent interface.
- Readable text.
- Simple forms.
- Mobile-friendly interactions.
- Clear statuses and feedback.

15. MVP Exclusions

- AI features or recommendations.
- Online payment processing.
- UPI or bank integrations.
- Vendor login portals.
- Dedicated Android or iOS applications.
- Advanced analytics.
- In-app notification centre.
- Automatic WhatsApp messaging.
- General activity-history module.
- Individual manager permission customisation.
- Wedding planner role.
- Multiple wedding ownership by one account.
- Guest-created photo albums.
- Bulk gallery ZIP downloads.
- Budget management.
- Side-by-side vendor comparison.
- Multilingual interface.

16. Product Success Criteria

- A bride and groom can create and manage one shared wedding workspace.
- Family members can join as managers.
- Both families can coordinate events and responsibilities.
- Guest families can receive unique invitations and submit RSVPs.
- Families can track expenses and instalment payments.
- Vendors can be discovered, contacted and managed.
- Wedding tasks can be assigned and tracked.
- Event-wise photographs and videos can be uploaded and accessed.
- Wedding records remain accessible after completion.
- The product remains easy to use on desktop and mobile.

17. Scope Governance

This PRD records the approved MVP requirements. Any feature not included in this document should be treated as outside the MVP unless explicitly approved.

Technology selection, system architecture, database design, API contracts, hosting and implementation details will be handled in subsequent planning stages.

End of PRD — WeddingOS v1.0
